acnOS

A MODERN IOT OPERATING SYSTEM AND THE FOUNDATION OF ALL ACONNO PRODUCTS

acnOS is aconno's operating system for BLE and NB-IoT devices. It combines a modern real-time operating system with BLE and NB-IoT connectivity, offering features such as configuration through smartphones and routers, OTA updates, and ultra-low-energy optimizations that lead up to 10 years of lifetime on a single coin cell! acnOS provides a high-level customization out-of-a-box for a wide range of customer use cases, making it a perfect choice for various industries - from retail or logistics to smart buildings.

acnOS is the foundation of all aconno products as well as the starting point for custom projects. Thanks to its maturity we are able to make custom-built IoT solutions in days or weeks that would otherwise take years to develop. acnOS is the product of many years of development and improvement.

Using acnOS as a foundation for new projects allows developers to avoid re-writing the same low-level code and focus on implementing the business logic instead. In combination with our Sensorics mobile app and IoT gateway, you will find acnOS convenient, user-friendly, and easy to control.
